ELÚA

Panadería & pastelería

PHASE 1 · IMPLEMENTATION PLAN

Elúa Kitchen

An internal tool to store Elúa's recipes once and scale them to any quantity and size, without a calculator or Excel.

Planning document · October 2026 · Version 2: decisions settled

01 Why this phase comes first

Elúa's long-term goal is to become a micro-bakery. Phase 1 builds the foundation the later phases depend on: a reliable, structured record of every recipe and every bake.

The problem we're solving

Today the hardest part of production is **calculating ingredients and adapting recipes to different quantities and sizes**. Every bake means recalculating by hand, which takes time and invites mistakes, and the more orders come in, the worse it gets.

The goal

> **Save a recipe once and get exact quantities for any production in under a minute, from your phone.**
>
> For example: "4 loaves of 800 g" or "4 loaves of 800 g + 6 loaves of 500 g" gives you a ready-to-weigh ingredient list.

Where Phase 1 fits

Phase	Focus	Status
1 · Elúa Kitchen	Recipes, versions, scaling calculator, combined production, saved batches	THIS DOCUMENT
2 · Elúa Operations	Costs and margins, inventory, suppliers, production calendar, internal orders	LATER
3 · Elúa Online	Public catalog, pre-sale dates, capacity limits, customer pre-orders	LATER
4 · Elúa Microbakery	Recurring production, demand, waste, sales and business reports	LATER

Phase 1 is for you only. Nothing is public and there are no customers, payments or inventory yet. Still, the data is structured so costs, inventory and orders can be added later without starting over.

02 Scope

Feature	Priority
Recipe book: create, edit and browse recipes with ingredients, units, yield and instructions	MUST
Baker's percentages: shown automatically for bread recipes, including true hydration with the starter counted	MUST
Recipe versions: editing a recipe creates a new version; old versions are kept	MUST
Scaling calculator: by number of pieces and dough weight per piece, including custom weights (750 g, 950 g…)	MUST
Combined production: several recipes or sizes at once, with one consolidated shopping/weighing list	MUST
Recipe import: paste a recipe as text or take a photo; AI fills in the form and you review it before saving	MUST
Process timers: each recipe knows its steps (autolyse, folds, bulk, proof); tap Start and the app runs the timers and notifies you	MUST
Saved batches: store a calculated production with its date so you can look it up later	MUST
Recipe components: e.g. cinnamon rolls = dough + filling + frosting, each scalable on its own	SHOULD
Adjust starter %: change the starter percentage and recalculate flour and water	SHOULD
Bake notes: temperature, timings, 1–5 rating, notes and a photo per batch	SHOULD
Starter (levain) planner and feed ratios; costs, inventory, suppliers, calendar, customer orders, payments	PHASE 2+

> **Definition of done for Phase 1**
>
> You can store all of Elúa's current recipes, calculate any production size, combine several products into one list, and pull up past calculations without opening Excel.

03 How it works

One main flow, designed to be done one-handed in the kitchen.

STEP 1
Pick a recipe
From the recipe book, e.g. "Pan clásico".

›

STEP 2
Set the production
How many pieces and the dough weight per piece. Add more recipes if needed.

›

STEP 3
Get quantities
Exact grams per ingredient, consolidated across recipes.

›

STEP 4
Save as a batch
Kept with its date and recipe version, plus notes after baking.

Screens

The UI is in Spanish. On the phone there's a bottom tab bar (Inicio · Recetas · Calcular · Lotes). An active process shows as a banner on every screen; on a computer it becomes a side menu.

Inicio home

- Shortcut: "Calcular producción"
- Recently used recipes
- Latest saved batches

Recetas recipe book

- List with search and category filter
- Recipe detail: ingredients, baker's %, hydration, instructions, versions
- Create / edit form with validation
- Import from text or photo → review → save

Calcular calculator

- Add one or more lines: recipe × pieces × weight
- Quick sizes (500 / 800 / 1,000 g) or a custom weight
- Result per recipe and a consolidated total
- Copy list · Save as batch

Lotes batches

- History of saved productions by date
- Batch detail with the exact quantities used
- Bake notes, rating and photo (should)

Proceso process timers

- "Iniciar proceso" from a recipe or batch
- Current step, countdown and what's next: "Pliegue 2 de 4 · 30 min"
- Notification when each step ends, even with the phone locked

Importar recipe import

- Paste text or take a photo of the recipe
- AI suggests ingredients, quantities, units and steps
- Nothing is saved until you confirm

04 Calculation rules

The calculator is the core of the app, so its rules are written down here and will be covered by automated tests.

Scaling by pieces and weight

```
factor       = (pieces × dough weight per piece) ÷ base dough weight
new quantity = base quantity × factor
```

Example with Elúa's classic recipe (base 647 g of dough), for **4 loaves of 800 g** → factor 3,200 ÷ 647 = 4.946:

Ingredient	Base recipe	4 × 800 g
Harina (flour)	350 g	1,731 g
Agua (water)	220 g	1,088 g
Masa madre (starter)	70 g	346 g
Sal (salt)	7 g	34.6 g
Total dough	**647 g**	**3,200 g**

Baker's percentages and true hydration

The starter contains flour and water too, so it has to be counted to get the real hydration. With the starter at 100% hydration (fixed in Phase 1; feeding and other hydrations come later):

```
flour in starter = starter ÷ (1 + starter hydration)        → 70 ÷ 2 = 35 g
total flour      = 350 + 35 = 385 g
total water      = 220 + 35 = 255 g
true hydration   = 255 ÷ 385 = 66.2 %       (water ÷ added flour alone would say 62.9 %)
salt             = 7 ÷ 385 = 1.8 % of total flour
```

The app shows both views: percentages over **added flour** (how most recipes are written) and over **total flour** (true hydration).

Combined production

Several lines are calculated separately and then added up by ingredient. Example: **4 × 800 g + 6 × 500 g** of the classic recipe:

Ingredient	4 × 800 g	6 × 500 g	Total to weigh
Harina	1,731 g	1,623 g	**3,354 g**
Agua	1,088 g	1,020 g	**2,108 g**
Masa madre	346 g	325 g	**671 g**
Sal	34.6 g	32.5 g	**67.1 g**
Total dough	**3,200 g**	**3,000 g**	**6,200 g**

Ingredients that must be prepared separately (a filling vs. a dough, say) stay on their own lines inside each recipe, so the consolidated list is for shopping and weighing, not for mixing everything together.

Process timers

Each recipe version stores its process as a list of steps. A step has a name, a duration, and optionally a number of repeats with an interval. Example for the classic loaf:

```
Autolyse            30 min
Folds               4 × every 30 min
Bulk fermentation   3 h
Shape               (manual: tap when done)
Proof (fridge)      12 h
```

Tapping **Iniciar** starts the first step. When a timer ends you get a notification; manual steps wait for you to tap "Listo". Steps can be paused, extended (+10 min) or skipped, because dough doesn't always follow the clock.

Rounding and precision

- All calculations keep full precision internally; rounding only happens on screen.
- Ingredients of 100 g or more show whole grams. Smaller amounts (salt, yeast, spices) show one decimal.
- Ingredients counted in units (eggs) show the weight and an approximate count, e.g. "2.4 huevos (≈ 120 g)".
- Weights are **dough weight before baking**. The app labels this clearly, because baked loaves weigh less.

05 How the data is organized

Recipes are stored as structured data, not as text, so the app can calculate with them now and add costs, inventory and orders later.

Entity	What it holds
Ingredient	Shared catalog: name, type (flour, liquid, starter, salt, fat, sugar, other), default unit. Later this is where cost and stock will live.
Recipe	Name, category (masa madre, pan dulce, repostería…), photo, base yield and base dough weight per piece
Recipe version	Version number, date and change note. Ingredients and steps belong to a version, not directly to the recipe.
Component	Optional part of a recipe (Masa, Relleno, Frosting) with its own ingredient lines
Ingredient line	Ingredient + quantity + unit (g, ml, unit), and whether it counts as flour for baker's %
Process step	Belongs to a recipe version: order, name, duration, repeats and interval, or "manual"
Process run	A started process: start time, current step, timestamps of each step (optionally linked to a batch)
Batch	A saved production: date, status, notes, rating, photo
Batch line	Recipe version used, pieces, weight per piece, mode, and a **snapshot** of the calculated quantities

> **Key rule: history never changes**
>
> A batch stores the exact recipe version and quantities it used. If you edit the recipe tomorrow, last week's batch still shows what you actually did.

06 Technology

Part	Choice	Why
App	Next.js + TypeScript	One codebase for the internal tool now and the public shop in Phase 3
Styling	Tailwind CSS	Brand colors become reusable design tokens
Database + login	Supabase (PostgreSQL)	Managed database and authentication; free tier is enough for one user
Hosting	Vercel	Automatic deploys, works well with Next.js; free tier
Tests	Vitest + Playwright	Unit tests for every calculation rule; end-to-end tests for the main flow
Recipe import	Claude Haiku (Anthropic API)	Reads pasted text and photos and returns a structured recipe; a few cents a month at this volume; key kept on the server
Notifications	Web Push + scheduled job	Timer alerts are sent by the server so they arrive with the phone locked (on iPhone the app must be added to the home screen)
Phone use	Installable web app (PWA)	Add to the home screen like an app; no app store needed

The whole app requires login. The future public shop will live in a separate section of the same project.

07 Milestones

Each milestone ends with something you can use and try out.

M0 — **Foundation**
Project setup, Supabase database and login, brand theme, navigation, deployed to a private URL.

M1 — **Recipe book**
Ingredient catalog, create/edit/list recipes, baker's % and true hydration, versions, import from text or photo. Load Elúa's real recipes.

M2 — **Scaling calculator**
Calculation engine with tests; single-recipe scaling by pieces and weight; rounding rules; copy list.

M3 — **Combined production**
Multiple lines, consolidated ingredient list, per-recipe breakdown, components.

M4 — **Batches**
Save production as a batch with snapshot; history; batch detail; bake notes and rating.

M5 — **Process timers**
Process steps per recipe, start/pause/extend/skip, push notifications with the phone locked.

M6 — **Polish and kitchen test**
Installable on the phone, end-to-end tests, a real production day using only the app.

08 Applying the Elúa brand

Taken from the brand files in Drive. The app should feel like Elúa without hurting readability in a bright kitchen.

Café
#D8854C
Brand color: logo, active tab, highlights, large headings

Crema
#FAE5D6
Backgrounds, cards, table headers

Coral
#F4917A
Warnings and attention states

Celeste
#8FC7C9
Info, status badges, success

Two colors to add for readability PROPOSAL

Café on light backgrounds has low contrast (2.3:1 on crema, 2.9:1 on white; small text needs at least 4.5:1). We'd add two supporting colors that stay on-brand:

- **Tinta #3A2A20** for body text (11.3:1 on crema)
- **Café oscuro #9A5426** for buttons and links (5.7:1 with white text)

- Logo: the horizontal version in the header; the emblem with a filled background as the app icon.
- Patterns: only as subtle decoration (empty states, login screen), never behind data.
- Body font: **Montserrat**, closest match to the logo's descriptor. The designer's .ai files have their text converted to outlines, so the original font name isn't recorded. The "ELÚA" wordmark is always the logo image, never typed.
- Vector logo: taken from the designer's *logos.ai* and *icono.ai* (exported to SVG), so no extra files are needed.

09 Decisions

Settled on 16 October 2026. These now shape the data model and the milestones.

1. **Entering recipes**
   Both grams and baker's percentages, entered in grams first.

2. **Loading recipes**
   Through the new import feature: paste text or take a photo, the AI fills the form, you review. Manual entry still works if the AI gets something wrong.

3. **Units**
   g, ml and units from the start.

4. **Starter**
   The starter planner and feed ratios move to a later phase. Phase 1 assumes a 100% hydration starter for the true-hydration calculation.

5. **Login**
   Email magic link.

6. **Brand**
   Taken from Drive: palette from the PNGs, vector logos from the .ai files. The font isn't recorded in the files (text is outlined), so we use Montserrat.

7. **Extra features**
   Process timers are added to Phase 1 (M5). They replace "Alexa, timer 30 minutes": the app already knows how many folds there are and when.

Still to provide

- The first 3 real recipes (text or photo), including their process steps and times.
- Accounts: GitHub, Supabase, Vercel and an Anthropic API key.
